ANNEX I

SUMMARY OF PRODUCT CHARACTERISTICS
1. NAME OF THE MEDICINAL PRODUCT

VPRIV 400 Units powder for solution for infusion

2. QUALITATIVE AND QUANTITATIVE COMPOSITION

One vial contains 400 Units* of velaglucerase alfa**. After reconstitution, one ml of the solution contains 100 Units of velaglucerase alfa.

*An enzyme unit is defined as the amount of enzyme that is required to convert one micromole of p-nitrophenyl β-D-glucopyranoside to p-nitrophenol per minute at 37°C.

**produced in an HT-1080 human fibroblast cell line by recombinant DNA technology.

Excipients with known effect:
One vial contains 12.15 mg sodium.

For the full list of excipients, see section 6.1.

3. PHARMACEUTICAL FORM

Powder for solution for infusion.
White to off-white powder.

4. CLINICAL PARTICULARS

4.1 Therapeutic indications

VPRIV is indicated for long-term enzyme replacement therapy (ERT) in patients with type 1 Gaucher disease.

4.2 Posology and method of administration

VPRIV treatment should be supervised by a physician experienced in the management of patients with Gaucher disease. Home administration under the supervision of a healthcare professional may be considered only for patients who have received at least three infusions and were tolerating their infusions well.

Posology

The recommended dose is 60 Units/kg administered every other week.

Dose adjustments can be made on an individual basis based on achievement and maintenance of therapeutic goals. Clinical studies have evaluated doses ranging from 15 to 60 Units/kg every other week. Doses higher than 60 Units/kg have not been studied.

Patients currently treated with imiglucerase enzyme replacement therapy for type 1 Gaucher disease may be switched to VPRIV, using the same dose and frequency.

Special populations
Renal or hepatic impairment

No dosing adjustment is recommended in patients with renal or hepatic impairment based on current knowledge of the pharmacokinetics and pharmacodynamics of velaglucerase alfa. See section 5.2.
**Elderly (≥65 years old)**
Elderly patients may be treated within the same dose range (15 to 60 U/kg) as other adult patients. See section 5.1.

**Paediatric population**
Twenty of the 94 patients (21%) who received velaglucerase alfa during clinical studies were in the paediatric and adolescent age range (4 to 17 years). The safety and efficacy profiles were similar between paediatric and adult patients. See section 5.1 for further information.

**Method of administration**
For intravenous infusion use only.
To be administered as a 60-minute intravenous infusion.
Must be administered through a 0.22 µm filter.
For instructions on reconstitution and dilution of the medicinal product before administration, see section 6.6.

**4.3 Contraindications**
Severe allergic reaction to the active substance or to any of the excipients listed in section 6.1.

**4.4 Special warnings and precautions for use**

**Hypersensitivity**
Hypersensitivity reactions have been reported in patients in clinical studies. As with any intravenous protein medicinal product, hypersensitivity reactions are possible. Therefore, appropriate medical support should be readily available when velaglucerase alfa is administered. If a severe reaction occurs, current medical standards for emergency treatment are to be followed.

Treatment should be approached with caution in patients who have exhibited symptoms of hypersensitivity to other enzyme replacement therapy.

**Infusion related-reactions**
Infusion-related reactions were the most commonly observed adverse reactions in patients treated in clinical studies. Most of the infusion-related reactions were mild. The most commonly observed symptoms of infusion-related reactions were: headache, dizziness, hypotension, hypertension, nausea, fatigue/asthenia, and pyrexia/body temperature increased. In treatment-naïve patients, the majority of infusion-related reactions occurred during the first 6 months of treatment.

The management of infusion-related reactions should be based on the severity of the reaction, and include slowing the infusion rate, treatment with medicinal products such as antihistamines, antipyretics and/or corticosteroids, and/or stopping and resuming treatment with increased infusion time.

Pre-treatment with antihistamines and/or corticosteroids may prevent subsequent reactions in those cases where symptomatic treatment was required. Patients were not routinely pre-medicated prior to infusion of velaglucerase alfa during clinical studies.

**Immunogenicity**
Antibodies may play a role in treatment-related reactions found with the use of velaglucerase alfa. To further evaluate the relationship, in cases of severe infusion-related reactions and in cases of lack or loss of effect patients should be tested for the presence of antibodies and the results reported to the company.

In the clinical trials, one of 94 (1%) patients developed IgG-class antibodies to velaglucerase alfa. In this one event, the antibodies were determined to be neutralising in an in vitro assay. No infusion-related reactions were reported for this patient. No patients developed IgE antibodies to velaglucerase alfa.
Sodium
This medicinal product contains 12.15 mg sodium per vial. To be taken into consideration by patients on a controlled sodium diet.

4.5 Interaction with other medicinal products and other forms of interaction
No interaction studies have been performed.

4.6 Fertility, pregnancy and lactation

Women of child bearing potential
Patients who have Gaucher disease and become pregnant may experience a period of increased disease activity during pregnancy and the puerperium. A risk-benefit assessment is required for each pregnancy. Close monitoring of the pregnancy and clinical manifestations of Gaucher disease is necessary for the individualisation of therapy.

Pregnancy
There are no data from the use of velaglucerase alfa in pregnant women. Animal studies do not indicate direct or indirect harmful effects with respect to pregnancy, embryonal/foetal development, parturition or postnatal development. Caution should be exercised when prescribing to pregnant women.

Breast-feeding
There are no data from studies in breast-feeding women. It is not known whether velaglucerase alfa is excreted in human milk. Because many active substances are excreted in human milk, caution should be exercised when prescribing to a breast-feeding woman.

Fertility
Animal studies show no evidence of impaired fertility.

4.7 Effects on ability to drive and use machines
VPRIV has no or negligible influence on the ability to drive or use machines.

4.8 Undesirable effects

The data described below reflect exposure of 94 patients with type 1 Gaucher disease who received velaglucerase alfa at doses ranging from 15 to 60 Units/kg every other week in 5 clinical studies. Fifty-four patients were naïve to ERT and 40 patients switched from imiglucerase to VPRIV. Patients were between 4 and 71 years old at the time of first treatment with VPRIV, and included 46 male and 48 female patients.

The most serious adverse reactions in patients in clinical trials were hypersensitivity reactions.

The most common adverse reactions were infusion-related reactions. The most commonly observed symptoms of infusion-related reactions were: headache, dizziness, hypotension, hypertension, nausea, fatigue/asthenia, and pyrexia/body temperature increased (see section 4.4 for further information). The only adverse reaction leading to discontinuation of treatment was an infusion-related reaction.

Adverse reactions reported in patients with type 1 Gaucher disease are listed in Table 1. Information is presented by system organ class and frequency according to MedDRA convention. Frequency is defined as very common (≥1/10) and common (≥1/100 to <1/10). Within each frequency grouping, adverse reactions are presented in order of decreasing seriousness.

Paediatric population
The safety profile of VPRIV in clinical studies involving children and adolescents aged 4 to 17 years was similar to that observed in adult patients.

Elderly population (>65yrs)
The safety profile of VPRIV in clinical studies involving patients aged 65 years and above was similar to that observed in other adult patients.

4.9 Overdose
There is no experience with overdose of velaglucerase alfa. The maximum dose of velaglucerase alfa in clinical studies was 60 Units/kg. See section 4.4.

5. PHARMACOLOGICAL PROPERTIES

5.1 Pharmacodynamic properties

Gaucher disease is an autosomal recessive disorder caused by mutations in the GBA gene which results in a deficiency of the lysosomal enzyme beta-glucocerebrosidase. This enzymatic deficiency causes an accumulation of glucocerebroside primarily in macrophages, giving rise to foam cells or "Gaucher cells". In this lysosomal storage disorder (LSD), clinical features are reflective of the distribution of Gaucher cells in the liver, spleen, bone marrow, skeleton, and lungs. The accumulation of glucocerebroside in the liver and spleen leads to organomegaly. Bone involvement results in skeletal abnormalities and deformities as well as bone pain crises. Deposits in the bone marrow and splenic sequestration lead to clinically significant anaemia and thrombocytopenia.

The active substance of VPRIV is velaglucerase alfa, which is produced by gene activation technology in a human cell line. Velaglucerase alfa is a glycoprotein. The monomer is approximately 63 kDa, has
497 amino acids, and the same amino acid sequence as the naturally occurring human enzyme, glucocerebrosidase. There are 5 potential N-linked glycosylation sites, four of which are occupied. Velaglucerase alfa is manufactured to contain predominantly high-mannose-type glycans to facilitate internalisation of the enzyme by the phagocytic target cells via the mannose receptor.

Velaglucerase alfa supplements or replaces beta-glucocerebrosidase, the enzyme that catalyzes the hydrolysis of glucocerebroside to glucose and ceramide in the lysosome, reducing the amount of accumulated glucocerebroside and correcting the pathophysiology of Gaucher disease. Velaglucerase alfa increases haemoglobin concentration and platelet counts and reduces liver and spleen volumes in patients with type 1 Gaucher disease.

In Studies 025EXT and 034, patients were offered home therapy. In Study 025EXT, 7 of 10 patients received home therapy at least once during 60 months of treatment. In Study 034, 25 of 40 patients received home therapy at least once during the 12-month study.

Clinical efficacy and safety

**Studies in treatment naïve patients**

Study 025 was a 9 month, open-label study in 12 adult (≥18 years) patients who were naïve to ERT (defined as having not been treated with ERT for at least 12 months prior to study entry). VPRIV was initially administered in a dose-escalating fashion in the first 3 patients (15, 30, 60 Units/kg) and the 9 remaining patients began treatment with 60 Units/kg.

Clinically meaningful improvements from baseline were observed in haemoglobin concentration and platelet counts as early as 3 months and in liver and spleen volumes at both 6 months and 9 months following the initiation of treatment with VPRIV.

Ten patients who completed Study 025 enrolled in an open-label extension study (025EXT) , 8 of whom completed the study. After a minimum of 12 months of continuous treatment with VPRIV, all patients qualified to have the dose of VPRIV reduced in a step-wise fashion from 60 to 30 Units/kg after achieving at least 2 of the 4 “Year 1” therapeutic goals of ERT for type 1 Gaucher disease. Patients received doses ranging from 30 to 60 Units/kg (median dose 35 Units/kg) every other week for up to 84 months (7 years). Sustained clinical activity continued to be demonstrated during treatment as observed by improvements in haemoglobin concentrations and platelet counts and reduced liver and spleen volumes.

By month 57, 8 out of the 8 patients had achieved a reduction of at least 2 points in the lumbar spine Bone Marrow Burden (BMB) score as assessed by MRI scan. Improvement from baseline in mean lumbar spine and femoral neck bone mineral density Z-scores were observed at month 24 (0.4; 95% CI 0.1, 0.7) and month 33 (0.4; 95% CI 0.2, 0.6), respectively. After seven years of treatment, the mean increase from baseline in Z-scores were 0.7 (95% CI 0.4, 1.0) for the lumbar spine and 0.5 (95% CI 0.2, 0.7) for the femoral neck. No patients were classified at a more severe WHO classification of bone density compared to baseline.

Study 032 was a 12-month, randomized, double-blind, parallel-group efficacy study in 25 patients aged 2 years and older who were naïve to ERT (defined as having not been treated with ERT for at least 30 months prior to study entry). Patients were required to have Gaucher disease-related anaemia and either thrombocytopenia or organomegaly. Patients were randomized to receive VPRIV at a dose of either 45 Units/kg (N=13) or 60 Units/kg (N=12) every other week.

Velaglucerase alfa 60 Units/kg given IV every other week demonstrated clinically meaningful increases from baseline in mean haemoglobin concentration (+2.4 g/dl) and platelet count (+50.9 x 10^9/l), liver volume was reduced from 1.46 to 1.22 times normal (mean reduction of 17%) and spleen volume was reduced from 14.0 to 5.75 times normal (mean reduction of 50%). Meaningful increases from baseline were observed in the 45 Units/kg dose group in haemoglobin concentration (+2.4 g/dl) and platelet count (+40.9 x 10^9/l), liver volume was reduced from 1.40 to 1.24 times normal
(mean reduction of 6%) and spleen volume was reduced from 14.5 to 9.50 times normal (mean reduction of 40%).

Study 039 was a 9-month, randomized, double-blind, non-inferiority, active-comparator (imiglucerase) controlled, parallel-group efficacy study in 34 patients aged 2 years and older who were naïve to ERT (defined as having not been treated with ERT for at least 12 months prior to study entry). Patients were required to have Gaucher disease-related anaemia and either thrombocytopenia or organomegaly. Patients received either 60 Units/kg of VPRIV (N=17) or 60 Units/kg of imiglucerase (N=17) every other week.

The mean absolute increase from baseline in haemoglobin concentrations was 1.624 g/dl (±0.223 SE) following 9 months of treatment with VPRIV. This increase in haemoglobin concentration was demonstrated to be clinically and statistically non-inferior to imiglucerase (mean treatment difference of change from baseline to 9 months [VPRIV – imiglucerase]: 0.135 g/dl). There were no statistically significant differences between VPRIV and imiglucerase in changes in platelet counts and liver and spleen volumes after 9 months of VPRIV treatment, and in the time to first haemoglobin response (defined as 1 g/dl increase from baseline).

Study in patients switching from imiglucerase treatment to VPRIV
Study 034 was a 12-month, open-label safety study in 40 patients aged 2 years and older who had been receiving treatment with imiglucerase at doses ranging from 15 to 60 Units/kg for a minimum of 30 consecutive months. Patients were required to have a stable dose of imiglucerase for at least 6 months prior to study enrolment. Treatment with VPRIV was administered as the same number of units and regimen as their imiglucerase dose. Haemoglobin concentration and platelet counts were evaluated as changes from baseline, which was defined as the end of the patient’s treatment with imiglucerase.

In patients who switched from imiglucerase to VPRIV, haemoglobin concentrations and platelet counts were sustained at therapeutic levels through 12 months of treatment.

Study 058 was an open-label clinical safety study in 211 patients including 205 patients previously treated with imiglucerase 6 treatment-naïve patients and 57 patients aged 65 years or older (56/57 had switched from imiglucerase to VPRIV). Patients transferring from imiglucerase were administered VPRIV infusions every other week at the same number of units as imiglucerase within the range of 15 to 60 U/kg. Patients transferring from a dose of <15 U/kg imiglucerase were administered 15 U/kg of VPRIV.

Patients previously treated with imiglucerase received a median of 8 VPRIV infusions with median duration of treatment of 15.1 weeks. The safety profile in these patients was similar to that observed in other clinical trials. Only 1 out of 163 patients assessed developed anti-velaglucerase alfa antibodies during the study.

The mean haemoglobin concentration and platelet count of patients previously treated with imiglucerase were maintained throughout the study and remained within the reference intervals.

Paediatric population
Use in the age group 4 to 17 is supported by evidence from controlled studies in adults and paediatric [20 of 94 (21%)] patients. The safety and efficacy profiles were similar between paediatric and adult patients. The studies allowed the inclusion of patients 2 years and older and the safety and efficacy profiles are expected to be similar down to the age of 2 years. However, no data are available for children under the age of 4 years.

The European Medicines Agency has waived the obligation to submit the results of studies with VPRIV in all subsets of the paediatric population with type 2 Gaucher disease and has deferred the obligation to submit the results of studies with VPRIV in one or more subsets of the paediatric population in Gaucher disease type 1 and 3, as per the PIP decision.
5.2 Pharmacokinetic properties

There were no apparent pharmacokinetic differences between male and female patients with type 1 Gaucher disease. None of the subjects in the pharmacokinetic studies were positive for anti-velaglucerase alfa antibodies on the days of pharmacokinetic evaluation. Therefore, it was not possible to evaluate the effect of antibody response on the pharmacokinetic profile of velaglucerase alfa.

Absorption
Velaglucerase alfa serum concentrations rose rapidly for the first 20 minutes of the 60-minute infusion before leveling off, and Cmax was typically attained between 40 and 60 minutes after the start of the infusion. After the end of the infusion, velaglucerase alfa serum concentrations fell rapidly in a monophasic or biphasic fashion with a mean t1/2 ranging from 5 to 12 minutes at doses of 15, 30, 45, and 60 Units/kg.

Distribution
Velaglucerase alfa exhibited an approximately linear (i.e. first-order) pharmacokinetic profile, and Cmax and AUC increased approximately proportional to the dose over the dose range 15 to 60 Units/kg. The steady state volume of distribution was approximately 10% of the body weight. The high clearance of velaglucerase alfa from serum (mean 6.7 to 7.6 ml/min/kg) is consistent with the rapid uptake of velaglucerase alfa into macrophages via mannose receptors.

Elimination
The range of velaglucerase alfa clearance in paediatric patients (N=7, age range 4 to 17 years) was contained within the range of clearance values in adult patients (N=15, age range 19 to 62 years).

5.3 Preclinical safety data

Non-clinical data reveal no special hazard for humans based on conventional studies of safety pharmacology, repeated dose toxicity, and toxicity to reproduction and development.

6. PHARMACEUTICAL PARTICULARS

6.1 List of excipients

Sucrose
Sodium citrate dihydrate (E331)
Citric acid monohydrate (E330)
Polysorbate 20

6.2 Incompatibilities

In the absence of compatibility studies, this medicinal product must not be mixed with other medicinal products.

6.3 Shelf life

3 years.

Reconstituted and diluted solution for infusion:
Chemical and physical in-use stability has been demonstrated for 24 hours at 2°C to 8°C under protection from light.
From a microbiological point of view, the medicinal product should be used immediately. If not used immediately, in-use storage times and conditions prior to use are the responsibility of the user and must not exceed 24 hours at 2°C to 8°C.

6.4 Special precautions for storage

Store in a refrigerator (2°C - 8°C).
Do not freeze.
Keep the vial in the outer carton in order to protect from light.

For storage conditions after reconstitution and dilution of the medicinal product, see section 6.3.

6.5 Nature and contents of container

20 ml vial (type I glass) with a stopper (fluoro-resin coated butyl rubber), one piece seal, and flip-off cap, containing 400 Units of velaglucerase alfa in powder. Pack sizes of 1, 5 and 25 vials.

Not all pack sizes may be marketed.

6.6 Special precautions for disposal and other handling

VPRIV requires reconstitution and dilution, and is intended for intravenous infusion only. VPRIV is for single-use only and is administered through a 0.22 µm filter.

Use aseptic technique.

Prepare VPRIV as follows:
1. The number of vials to be reconstituted is determined based on the individual patient’s weight and the prescribed dose.
2. The required vials are removed from the refrigerator. Each 400 Units vial is reconstituted with 4.3 ml of sterile water for injections.
3. Upon reconstitution, mix vials gently. Do not shake. Each vial will contain an extractable volume of 4.0 ml (100 Units/ml).
4. Prior to further dilution, visually inspect the solution in the vials; the solution should be clear to slightly opalescent and colourless; do not use if the solution is discoloured or if foreign particulate matter is present.
5. The calculated volume of medicinal product is withdrawn from the appropriate number of vials and the total volume required is diluted in 100 ml of sodium chloride 9 mg/ml (0.9%) solution for infusion. Mix gently. Do not shake. The infusion should be initiated within 24 hours from the time of reconstitution.

Any unused medicinal product or waste material should be disposed of in accordance with local requirements.

7. MARKETING AUTHORISATION HOLDER

B. CONDITIONS OR RESTRICTIONS REGARDING SUPPLY AND USE

Medicinal product subject to restricted medical prescription. (see Annex I: Summary of Product Characteristics, 4.2).

C. OTHER CONDITIONS AND REQUIREMENTS OF THE MARKETING AUTHORISATION

- Periodic Safety Update Reports

The marketing authorisation holder shall submit periodic safety update reports for this product in accordance with the requirements set out in the list of Union reference dates (EURD list) provided for under Article 107c(7) of Directive 2001/83/EC and published on the European medicines web-portal.

D. CONDITIONS OR RESTRICTIONS WITH REGARD TO THE SAFE AND EFFECTIVE USE OF THE MEDICINAL PRODUCT

- Risk Management Plan (RMP)

The MAH shall perform the required pharmacovigilance activities and interventions detailed in the agreed RMP presented in Module 1.8.2 of the Marketing Authorisation and any agreed subsequent updates of the RMP.

An updated RMP should be submitted:

- At the request of the European Medicines Agency.
- Whenever the risk management system is modified, especially as the result of new information being received that may lead to a significant change to the benefit/risk profile or as the result of an important (pharmacovigilance or risk minimisation) milestone being reached.
If the submission of a PSUR and the update of a RMP coincide, they can be submitted at the same time.

VPRIV 400 Units powder for solution for infusion
velaglucerase alfa

Read all of this leaflet carefully before you start using this medicine because it contains important information for you.
- Keep this leaflet. You may need to read it again.
- If you have any further questions, ask your doctor.
- If you get any side effects, talk to your doctor. This includes any possible side effects not listed in this leaflet.

What is in this leaflet

1. What VPRIV is and what it is used for
2. What you need to know before you use VPRIV
3. How to use VPRIV
4. Possible side effects
5. How to store VPRIV
6. Contents of the pack and other information

1. What VPRIV is and what it is used for

VPRIV is a long-term enzyme replacement therapy (ERT) for patients with type 1 Gaucher disease.

Gaucher disease is a genetic disorder caused by a missing or defective enzyme named glucocerebrosidase. When this enzyme is missing or does not work properly, a substance called glucocerebroside builds up inside cells in the body. The build-up of this material causes the signs and symptoms found in Gaucher disease.

VPRIV is designed to replace the missing or defective enzyme, glucocerebrosidase, in patients with Gaucher disease.

2. What you need to know before you use VPRIV

Do not use VPRIV:
- If you are allergic to velaglucerase alfa or any of the other ingredients of this medicine (listed in section 6).

Warnings and precautions
Talk to your doctor before using VPRIV
- If you are treated with VPRIV, you may experience a side effect during or following the infusion (see section 4, possible side effects). This is known as an infusion-related reaction and can sometimes be severe.
  - Infusion-related reactions include dizziness, headache, nausea, low or high blood pressure, tiredness, and fever. If you experience an infusion-related reaction, you must tell your doctor immediately.
  - If you have an infusion-related reaction you may be given additional medicines to treat or help prevent future reactions. These medicines may include antihistamines, antipyretics, and corticosteroids.
  - If the infusion-related reaction is severe, your doctor will stop the intravenous infusion immediately and start giving you appropriate medical treatment.
- If the infusion related reactions are severe and/or there is a loss of effect from this medicine, your doctor will perform a blood test to check for antibodies which may affect the outcome of your treatment.
- Most of the time you can still be given VPRIV even if you experience an infusion-related reaction.

Tell your doctor if you have previously experienced an infusion-related reaction or allergic reaction with other ERT for Gaucher disease.

**Children**

VPRIV should not be used in children under the age of 2 years.

**Other medicines and VPRIV**

Tell your doctor if you are taking, have recently taken or might take any other medicines.

**Pregnancy and breast-feeding**

If you are pregnant or breast-feeding, think you may be pregnant or are planning to have a baby, ask your doctor for advice before taking this medicine.

Gaucher disease may become more active in a woman during pregnancy and for a few weeks after birth. Women with Gaucher disease who are considering pregnancy should talk with their doctor.

VPRIV has not been studied in pregnant women. Studies in animals do not show harmful effects from VPRIV. Caution should be exercised when using VPRIV in pregnancy.

VPRIV has not been studied in women who are breast-feeding and it is not known whether VPRIV appears in breast milk. However, VPRIV contains a protein that may be digested by the child. Cautious use of VPRIV during breast feeding is recommended.

Ask your doctor or pharmacist for advice before taking any medicine.

**Driving and using machines**

VPRIV has no or negligible influence on your ability to drive or use machines.

**VPRIV contains sodium**

Each 400 Units vial of this medicine contains 12.15 mg sodium. This should be taken into consideration by patients on a controlled sodium diet.

**3. How to use VPRIV**

VPRIV is only to be used under appropriate medical supervision of a doctor who is knowledgeable in the treatment of Gaucher disease. VPRIV is given by a doctor or nurse by intravenous infusion.

**Dose**

The recommended dose is 60 Units/kg given every other week.

If you are currently being treated for Gaucher disease with another ERT and your doctor wants to change you to VPRIV, you can initially receive VPRIV at the same dose and frequency you had been receiving the other ERT. In clinical studies, doses ranging from 15 Units/kg to 60 Units/kg have been used.

**Use in children and adolescents**

VPRIV may be given to children and adolescents (2 to 17 years of age) at the same dose and frequency as in adults.
Use in elderly
VPRIV may be given to the elderly (aged over 65 years) at the same dose and frequency as in adults.

Response to treatment
Your doctor will monitor your response to treatment and may change your dose (up or down) over time.

If you are tolerating your infusions well in the clinic, your doctor or nurse may administer your infusions at home.

Administration
VPRIV is supplied in a vial as a packed powder which is mixed with sterile water and further diluted in sodium chloride 9 mg/ml (0.9%) solution prior to intravenous infusion.

After preparation, your doctor or nurse will give VPRIV to you through a drip into a vein (by intravenous infusion) over a period of 60 minutes.

If you use more VPRIV than you should
If you feel ill whilst receiving the infusion, tell your doctor or nurse immediately.

If you forget to use VPRIV
If you have missed an infusion, please contact your doctor.

If you stop using VPRIV
Discuss changes in treatment with your doctor.
If you have any further questions on the use of this medicine, ask your doctor.

4. Possible side effects

Like all medicines, this medicine can cause side effects, although not everybody gets them.

However a few patients experienced an allergic skin reaction such as severe rash or itching. A severe allergic reaction, with difficulty breathing, swelling of the face, lips, tongue or throat occured. If any of these happen tell your doctor immediately.

In studies with VPRIV, most side effects occurred during the infusion or shortly after. These are called infusion-related reactions and include;
- headache
- dizziness
- fever/body temperature increased
- decreased blood pressure or increased blood pressure
- nausea and tiredness
If you experience any side effect like these, please tell your doctor immediately. The majority of these side effects were mild in intensity.

In studies with VPRIV additional side effects have also been reported:

Very common side effects (affecting more than 1 person in 10) are:
- bone pain
- joint pain
- back pain
- weakness/loss of strength/fatigue

Common side effects (affecting less than 1 person in 10) are:
- abdominal pain/nausea
- easy bleeding / easy bruising
- skin flushing
- rapid heart beat
- rash/hives
- developing antibodies to VPRIV (see section 2)

If you get any side effects, talk to your doctor. This includes any possible side effects not listed in this leaflet.

5. **How to store VPRIV**

Keep this medicine out of the sight and reach of children.

Do not use this medicine after the expiry date which is stated on the carton and label after ‘EXP’. The expiry date refers to the last day of that month.

Store in the refrigerator (2°C - 8°C).
Do not freeze.
Keep the vial in the outer carton in order to protect from light.
Do not use if the solution is discoloured or if foreign particles are present.

Do not throw away any medicines via wastewater or household waste. Ask your pharmacist how to throwaway medicines you no longer use. These measures will help to protect the environment.

6. **Contents of the pack and other information**

**What VPRIV contains**
- The active substance is velaglucerase alfa.
  One vial of VPRIV 400 Units powder contains 400 Units of velaglucerase alfa.
  After reconstitution, one ml of solution contains 100 Units of velaglucerase alfa
- The other ingredients are sucrose, sodium citrate dihydrate, citric acid monohydrate and polysorbate 20 (see section 2 “VPRIV contains sodium”).

**What VPRIV looks like and contents of the pack**
VPRIV 400 Units powder: 20 ml glass vial containing 400 Units velaglucerase alfa.
Cartons with 1, 5 or 25 vials.
Not all pack sizes may be marketed.

**Marketing Authorisation Holder and Manufacturer**

Other sources of information
Detailed information on this medicine is available on the European Medicines Agency web site: http://www.ema.europa.eu. There are also links to other websites about rare diseases and treatments.

This leaflet is available in all EU/EEA languages on the European Medicines Agency website.

The following information is intended for healthcare professionals only.

VPRIV is a powder for solution for infusion. VPRIV requires reconstitution and dilution and is intended for intravenous infusion only. VPRIV is for single-use only and is administered through a 0.22 µm filter. Vials are single-use only. Discard any unused solution. VPRIV should not be infused with other medicines in the same infusion as the compatibility in solution with other medicines has not been evaluated. The total volume of infusion should be delivered over a period of 60 minutes.

Use aseptic technique.

Prepare VPRIV as follows:
1. The number of vials to be reconstituted is determined based on the individual patient’s weight and the prescribed dose.
2. The required vials are removed from the refrigerator. Each vial is reconstituted using sterile water for injections:

<table>
<thead>
<tr>
<th>Vial size</th>
<th>Water for Injections</th>
</tr>
</thead>
<tbody>
<tr>
<td>400 Units</td>
<td>4.3 ml</td>
</tr>
</tbody>
</table>

3. Upon reconstitution, mix vials gently. Do not shake.
4. Prior to dilution, visually inspect the solution in the vials; the solution should be clear to slightly opalescent and colourless; do not use if the solution is discoloured, or if foreign particulate matter is present.
5. The calculated volume of medicinal product is withdrawn from the appropriate number of vials. Some solution will remain in the vial:

<table>
<thead>
<tr>
<th>Vial size</th>
<th>Extractable volume</th>
</tr>
</thead>
<tbody>
<tr>
<td>400 Units</td>
<td>4.0 ml</td>
</tr>
</tbody>
</table>

6. The total volume required is diluted in 100 ml of sodium chloride 9 mg/ml (0.9%) solution for infusion. Mix gently. Do not shake. The infusion should be initiated within 24 hours from the time of reconstitution.

From a microbiological point of view, the medicine should be used immediately. If not used immediately, in-use storage times and conditions prior to use are the responsibility of the user and must not exceed 24 hours at 2°C to 8°C.

Medicines should not be disposed of via waste water or household waste. Any unused medicine or waste material should be disposed of in accordance with local requirements.
